Hi,

While I understand and support the need for social and affordable housing why are you opting to build 6000 new expensive executive homes on the green belt? No working class ordinary joe would be able to afford the mortgage on one of these properties, and the land owner/property developer is going after a fat profit and doesn't really care about anything else, certainly not what's good for the people of Enfield. The Council want to save the green belt from developers, well the developers own the land so, just say no to the 6000 new executive new builds, that will protect the green belt or will you just take the easy option?

The council have said in their leaflets on the "Local Plan" that they are "Investing in Enfield green spaces and addressing climate change".

Why are you letting Tottenham Hotspur F.C. build on half of Whitewebbs park? Do they really need it? They have 15 full size pitches to train on as well as many smaller training pitches which is more than most other teams in the Premier League who have women's football teams and female football academy's and why is it that Tottenham feel that the women can't train and use they same facilities as the men's team other teams do and have done for a while now.

Sounds like the easy option.

When looking at current New Builds that have or are coming to the market in the borough, most still have "Gas central heating, oven and hob" why? You have allowed the developers to get away with building new homes with old systems. Very few have solar panels and even less use air or ground heat pumps.

Sounds like the easy option.

You want to build on local car parks, why not instead build above them you could look into the Zed Pod system which would allow the parking space to still be used.

And now that the council have approved the building of new housing on the colosseum retail park, will you follow the example of Sunderland council where they now have several tower blocks that have no gas appliances? They only use electrical appliances throughout using ground source heat pumps and Sun Amp battery systems to provide hot water and heating to all the flats in the tower blocks. There are other options for heating and energy storage, like inferred heating, etc.

Tourists that fly into the UK remark on "How green the country is and how many green parks London has" so, why is it that you want to build on the green belt, the "Lungs" of London.

Save the Green Belt.

Not only the easy option, but the best.
